

CHAPTER 3

DATA REPRESENTATION

INTRODUCTION

Digital technology have found their way into innumerable areas of technology and the far most reaching is digital computers. In digital systems like computer ,the quantities are measured by symbol called digits. They occur in various forms like binary, octal, hexadecimal.

DIGITAL NUMBER SYSTEM

DECIMAL NUMBER SYSTEM

The number system is composed of 10 symbols (0,1,2,3,4,5,6,7,8,9).

Binary number system

To design an electronic system that can work with 10 different numbers is very difficult, and it is easy to use a number system with base 2 so binary digits are used. Ex 10001101

DIGITAL NUMBER SYSTEM

- ✓ Octal number system is also very important in digital system. It is number system with base 8.
- ✓ Hexadecimal number system uses base 16 from 0-9 and a, b, c, d, e, f as 16 symbols.

NUMBER CONVERSION

- ✓ The binary number system is very important as it is easy to feed it in a circuitry ,but we use decimal no. system
So there is a conversion need from one form to another.

DECIMAL TO BINARY

Divide the number to be converted and write its remainder, the remainder are its binary form.

FRACTION TO BINARY

Successively multiply the decimal by the radix.

BINARY TO DECIMAL FRACTION

Any binary number can be converted by summing up its positional value.

Ex.

$$(10110)_2$$

$$2^4 + 2^2 + 2^1 + 2^0 = 20$$

BINARY REPRESENTATION OF INTEGER

1. Sign and magnitude representation is the conventional form of number system. It is represented as signs (+ or -).
2. One's complement represents positive numbers by their binary equivalent called true value.
3. Two complement representation represents their binary equivalent numbers and negative numbers by their second compliment form.

BINARY REPRESENTATION OF REAL NUMBERS

- ✓ Real numbers are represented in storage medium by their exponents and mantissa. For example numbers 32.17 can be written as 0.3217×10^2 , 0.3217 is its mantissa and 2 is its exponent.

ASCII

- ✓ The **American Standard Code for Information Interchange (ASCII)** is a character-encoding scheme originally based on the English alphabet. ASCII codes represent text in computers, communications equipment, and other devices that use text. Most modern character-encoding schemes are based on ASCII, though they support many more characters than ASCII does.

ISCII

- ✓ In recent past the computer activities were limited to specific languages and with the increase in works there was to be develop a slandered code . In 1991, the bureau of Indian standard develop common code called **ISCII**. this is a 8-bit code capable of coding 256 characters.

UNICODE

- ✓ Unicode provides a unique number for every character,
- ✓ No matter what the platform
- ✓ No matter what the program.
- ✓ No matter what the language.

INDIAN LANGUAGES ON UNICODE

The standard has incorporated Indian scripts under group name Asian scripts , includes Devnagari ,Bengali ,Tamil ,Malayalam.
